

ABSTRACT OF THE DISCLOSURE

A tossing game includes a pair of open ended target receptacles, which are buried in the ground at some predetermined distance apart from one another with their upper rims flush with the surface. A series of relatively small tossing objects are provided to the players, who attempt to toss the objects into one target receptacle while standing just back of the opposite target receptacle. The targets may comprise relatively large diameter electrical metal tubing, polyvinyl chloride pipe, or other suitable material as desired. The tossing objects may comprise a series of relatively large diameter steel washers, or other suitable objects as desired. Preferably, the tossing objects are differentiated in some manner, into sets used by the different players. Scoring is according to the accuracy of each toss, with a cancellation system being used for like tosses by opposing players.
